

Workshop 4 Report

1. **NO_NETWORK_POLICY**: The misconfiguration category that is related with not specifying network policies. Without specifying network policies, Kubernetes installations are susceptible to unauthorized accesses.
2. **NO_ROLLING_UPDATE**: The misconfiguration category that is related to not explicitly specifying RollingUpdate in the configuration file. A lack of rolling updates makes a Kubernetes installation susceptible to supply chain-related attacks.
3. **INSECURE_HTTP**: This misconfiguration relates to the use of insecure HTTP connections instead of HTTPS, which makes communication vulnerable to eavesdropping and man-in-the-middle attacks.
